

Tonearm fitting Instructions

The **RB250** is one of the most popular tonearms in the World. It is fitted as standard to the famous Rega P2 turntable and is also the choice of many other turntable manufacturers on an OEM basis. You will see a photograph most months in nearly all hi-fi magazines globally of a Rega built tonearm.

The Rega **RB250** tonearm is a precision crafted product. To create the low friction levels and meet minimum mass requirements many parts of the arm are delicate and require careful handling. The arm should always be treated with respect

and under no circumstances should any part be removed or tampered with.

Fitting

With the cartridge fitted and aligned using the alignment protractor supplied, ensure that the bias adjustment slider is set to zero. Screw the balance weight along its shaft until the stylus is "floating" just 1mm clear of the record.

The recommended tracking force can now be applied by rotating the balance weight so that it moves towards the front of the arm. A half turn gives 1g tracking force. The black plastic plugs on the weight can be used to apply a force which corresponds to the upper limit of the cartridge maker's recommended range.

Set the bias adjustment slider to the same number as the tracking force control -

i.e. 1 1/2 g tracking force = 1 1/2 on the bias slider.

Your **RB250** is now ready for use.

Balance Weight.

Bias adjustment slider

Alignment protractor

Finally, we would like to thank you for purchasing our product and we wish you many happy hours of musical enjoyment.

Long live vinyl!
